                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 828
                                                                                                                                                                              Gaps
                                                                                                                                                                                                                 The sequences given in AAT41786-88 encode fusion proteins which are composed of a peptide having human granulocyte colony stimulating factor (AG-CSF) activity fused with a peptide having thrombopietin (TPO) activity, opt. via a spacer peptide. Peptides derived from these by deletion, insertion or substitution of one or more amino acid residues are included within the scope of the invention. The fusion peptides stimulate blood platelet and leukocyte production and are useful in the treatment of anaemia.

Peptides derived from these by deletion, insertion or substitution of one or more amino acid residues are included within the scope of the invention. The fusion peptides stimulate blood platelet and leukocyte production and are useful in the treatment of anaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequences given in AAT41786-88 encode fusion proteins which are

      This sequence represents the coding sequence for a thrombopoietin (TPO) protein. TPO is a humoral factor capable of promoting platelet production. The encoded protein can be purified by using a gel affinity column where Mpl has been coupled to a reain. AAAQ99551 and AAQ99553 also encode TPO proteins. The DNA sequences are inserted into vectors which are used to transform prokaryotic and eukaryotic host cells. Using the proteins encoded by these sequences, and derivatives of them, antibodies specifically immunoreactive with a TPO protein can be created. The antibodies. DNA sequences and vectors are used to isolate the protein sequences. The TPO proteins can then be used in the treatment of platelet disorders. These include thrombocytopenia, hypoplastic anamemia, ADDS, disseminated intravascular coagulation syndrome and

protein that stimulates megakaryopoiesis and thrombocytopoiesis. The cDNA can be incorporated into an expression vector and utilised in the prodn. of low mol.wt. bioactive human thrombopoietin in thrombopoietin (partic. yeast or mammalian) host cells. The recombinant thrombopoietin has an N-terminus at Ser-22 and a C-terminus between Arg-185 and Asn-192 (esp. Arg-198 or Phe-207), and is useful for increasing platelet prodn. in the treatment of thrombocytopenia or for increasing proliferation of cells in bone marrow.

                                                                                                                                                                                                                                                                                                                                        It was isolated by PCR from human liver and kidney cDNA templates using primers (see also AAT37385-88) derived from exon sequences of a human genomic TPO clone (see also AAT37384) and from the conserved 5' untranslated sequence of mouse TPO cDNA (AAT37382). The cDNA can be used to produce recombinant mature TPO in transformed host cells. Purified, homogeneous TPO is obtd. that is suitable for therapeutic

In a claimed method, thrombopoietin (TPO) (especially human TPO) is administered to a donor to stimulate proliferation of myeloid cells. Bone marrow or peripheral blood stem cells are collected from the donor and administered to the recipient. The method is used for preparing cells for (bone marrow) transplantation and for stimulating

platelet or erythrocyte recovery in a patient receiving chemotherapy or radiation therapy for e.g. breast cancer, leukaemia, lymphoma or multiple myeloma. Treating the donor with TPO accelerates restoration of erythrocyte and thrombocyte levels in the patient after transplant. This restoration may be further improved by administering TPO to the recipient after transplant. The present sequence encodes human TPO.
                                                                                                                                                                                                                                                                                                                                                                                                                       480

This cDNA encodes a thrombopoietin (TPO) polypeptide. This can be used in the construction of a new expression vector replicable in a cuaryotic host cell encoding TPO polypeptides. The vector comprises a transcription promoter, a first DNA segment encoding a secretory leader, a second segment encoding a TPO polypeptide and a transcription a second segment encoding a TPO polypeptide and a transcription terminator which are all operably linked. The second TPO segment consists of C-X-B, where C is a human TPO cytokine domain, X is a peptide bond or a linker consisting of one or two amino acid residues, such that X along in combination with C or B does not provide a dibasic maino acid pair and B is a polypeptide that can be selected from AAM53125 to AAM53126. The secretory leader is a S. cerevisiae alpha-factor secretory leader. A cultured yeast cell containing such an expression vector can be used to produce the TPO polypeptide. The TPO polypeptide can be used to increase for increasing platelet number in a mammal. It can be used to increase them charactery or congenital cytopenias. It can also be used to treat the charactery or congenital cytopenias. It can also be used to treat the characteries of the second production of sord disorders, such as leukaemia and lymphoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Stable thrombopoietin (TPO) compsns. containing TPO and an additive, pref. human serum albumin and/or gelatine, etc., are claimed. The compsns. do not lose TPO activity on storage in a container as the compsn. has reduced adsorption onto the container walls. The present sequence encodes recombinant immature human TPO (1-332).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MGDE-2) is active supports this hypothesis. Various active molecules that may result from truncations of the sequence set forth as MGDE-1 (AAR80824, aAR80825, aAR80825, AAR80825 aAR80826 as the signal peptide. The preferred truncation variants of MGDE-1 are any of those that have C-terminal truncations from AA 173-353
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mpl ligand is synonymous with MGDF. Mpl ligands are mammalian megakaryocyte growth promoting and/or platelet producing factors. MGDF-1 is a truncated portion of MGDF-1. It is hypothesised that human MGDF is expressed in vivo as a substantially inactive or less active precursor polypeptide that contains variable C-terminal AAs. Upon cleavage of the C-terminal AAs (as well as the signal peptide), the processed form(s) of the molecule retain activity or become more active. It is believed that MGDF-1 may require processing in order to exhibit its activity. The fact that a truncated form MGDF-1 (i.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

This sequence encodes native human mpl ligand. The invention concerns analogues of mpl ligand which have altered glycosylation patterns. Alteration of glycosylation of mpl ligand can cause improved biological activity. The mutated proteins comprise a greater or lesser number of carbohydrate side chains and higher or lower sialic acid content than wild type mpl ligand. Compositions comprising the mpl ligand analogues of the invention may be used to treat diseases involving an existing or expected megakaryocyte/
                                                                                                                                                                                                                                                                                                                                                                                                         ATGGAGCTGACTGACTCCTCCTCGTGCTATCTTCTCTAACTGCAAGGCTAACGCTG

CDNA Library Preparation: CLONTECH Laboratories, Inc.

CDNA Library Arrayed by: The I.M.A.G.E. Consortium (LLNL)

DNA Sequencing by: Incyte Genomics, Inc.

Clone distribution: MGC clone distribution information can be http://image.lln.gov

Plate: LLCM1541 row: b column: 24

High quality sequence stop: 597.

Location/Qualifiers

1. 598

/loce="Organ: liver; Vector: pME18S-FL3; Site_1: DraIII
(CACGTGTG); Site_2: braIII (GACCATGTG); 1st strand cDNA
was primed with an oligo(dT) primer
[ATGTGGCCTTTTTTTTTTTTTTT]; double-stranded cDNA was
ligated to a DraIII adaptor [TGTTGGCCTATGTG], digested
and cloned into distinct DraIII sites of the pME18S-FL3
vector (5' site CACGTGTG, 3' site CACATGTG). XhoI should
be used to isolate the CDNA insert. Size selection was
performed to exclude fragments <1.5kb. Library
constructed by Dr. Sumio Sugano (University of Tokyo
Institute of Medical Science). Custom primers for
sequencing: 5' end primer CTTCTGCTCTAAAAGCTGCG and 3' end
primer CGACCTGCAGCACA."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114)gblAR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mus musculus Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Butaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Musmalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus. 1 (bases 1 to 708)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (http://www.fax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymerlectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMD42 (qi|q'32114 qb|Arl29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPC1-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; on bw sp, the same strain used for the BDGP's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
